About me

A versatile Software Engineer with 2+ years of experience building scalable web applications and browser extensions, with a proven track record of delivering high-impact, user-centric solutions across QA automation and SaaS domains; currently deepening backend expertise with Node.js, AWS, and Java, while integrating AI-driven features and actively transitioning into a full-stack engineering role.

EDUCATION

Manipal Institute Of Technology,Manipal **July 2019 - OCT 2022**

Bachelor of Technology *CGPA: 7.01/10*

WORK EXPERIENCE

Associate Product Developer, Nogrunt **Apr 2023 - Present**

- Developed a frontend Suite Page that enabled users to bundle multiple test cases into a single suite, allowing sequential execution with a single click — streamlining testing workflows and reducing manual effort by 70%.
- Implemented efficient pagination on the test case selection page, significantly improving load times and user experience when bundling test cases into suites — enhanced performance for large datasets by reducing render time by over 40%.
- Integrated API testing capabilities into the existing web testing platform, eliminating the need for customers to use separate tools — aligned with client requirements and increased platform adoption by offering an all-in-one testing solution.
- Took full ownership of the core bot engine — the heart of a no-code testing platform — responsible for capturing user interactions and transmitting structured data to the backend via APIs, enabling QA teams to generate test cases in minutes instead of hours.
- Engineered a Unique Locator algorithm to reliably identify dynamic, index-based, and class-based elements — improving test stability and reducing locator-related test failures by over 80% in dynamic web applications.
- Developed a test coverage data collector to analyze the impact of executed test cases across the application — the collected data also powered AI models for intelligent test case generation, enhancing test accuracy and automation efficiency.
- Built a test analysis feature to automatically detect and diagnose test case failures — accelerated debugging and improved QA turnaround time by providing clear insights into failure points.

PROJECTS

Stock Tracking & Alert System: (MERN, Telegram API, Python (AI modules)) **Dec 2024-present**

- Designed and developed a personalized stock monitoring system that sends Telegram alerts when stock prices approach custom-drawn trendlines within a defined percentage threshold.
- Solved a real-life investment pain point by automating technical pattern tracking and reducing manual chart analysis time.
- Currently integrating AI to analyze company balance sheets, extract key news, and identify influential directors/employees — helping guide smarter, data-backed investment decisions.

Blog application: (Spring Boot, MySQL); Self Project **Aug 2024**

- Built backend infrastructure for a blog platform with RESTful APIs in Spring Boot, enabling CRUD operations for posts, categories, and comments.
- Designed and normalized a MySQL database schema with Hibernate ORM, utilizing indexing and relationships for efficient data management.
- Implemented secure role-based authentication and authorization with the help of Spring Security and JWT.

SKILLS & EXPERTISE

Programming Languages: HTML, CSS, JavaScript, React, Typescript, Java

Technical skills: Data Structure & Algorithms, OOPs(Object Oriented Programming) Concepts, LLD(low level design)

Tools & Frameworks: NodeJs, Express, Intelij, VS Code, GitHub, jira, kafka

Databases: MongoDB
